CA Glue Products

Cyanoacrylate Adhesives, Activator & Remover

CA Adhesive (cyanoacrylate) or super glues have become a major component in furniture cabinet manufacturing and repair. Glue bottle features a unique pin-in-cap which prevents the glue tip from clogging up.

CA-1 (thin/red) is a water-thin consistency and is used to penetrate (or wick) deep down into very tight joints. It has a very quick set time of as little as 5-10 seconds.

CA-2 (medium/yellow) is a little thicker than the red with enough body to not soak right into the woods pores. It is the perfect general purpose choice with a set time of 10-15 seconds.

CA-3 (thick/green) is thick like syrup, it is often used for applications where gap filling is necessary (first, do initial gluing with red or yellow, then follow-up with the green to fill voids). It has a very slow set time of 50-60 seconds.

The Activator (accelerator) is not required but has many uses to assist in the gluing process. The activator when sprayed onto the glued area will cause the cure to take place almost immediately. A typical procedure would be to: apply glue to the wood, position the wood, then spray activator while still holding the position, the quick cure from the activator will secure the wanted position.

CAR (remover/de-bonder) is a solvent that will slowly dissolve the cured CA glue.

- CA-1 Thin Glue 2 oz (Red)
- CA-2 Medium Glue 2 oz (Yellow)
- CA-3 Thick Glue 2 oz (Green)
- CAP Pump Activator 4 oz
- CAA Aerosol Activator 10 oz
- CAR Remover/De-bonder 2 oz
- CA-pincap Replacement Cap
